

Portfolio Website Command Sheet

Jamie Williams - Astro site on GitHub and Cloudflare Pages

Folder location

Your website folder is stored on the external drive. Because the path has spaces, always use quotes.

```
cd "D:\Profile and Personal\portfolio"
```

Open the site locally

Use this when you want to preview the site on your own computer while editing.

```
cd "D:\Profile and Personal\portfolio"  
npm.cmd run dev -- --host 127.0.0.1 --port 4322  
Open: http://127.0.0.1:4322/
```

Stop the local preview

In the PowerShell window running the site:

```
Ctrl + C  
Y
```

Check the site builds

Run this before pushing updates live. If this fails, fix the error before pushing.

```
npm.cmd run build
```

See what changed

```
git status
```

Save and push changes live

Use this after you or Claude changes the website. Cloudflare will rebuild automatically after git push.

```
git add .  
git commit -m "Update portfolio"  
git push
```

Normal update routine

This is the main routine you will use most of the time.

```
cd "D:\Profile and Personal\portfolio"  
npm.cmd run build  
git status  
git add .  
git commit -m "Update portfolio"  
git push
```

Add new images or videos

Put new assets in the public folder, then reference them from the site using a leading slash.

```
D:\Profile and Personal\portfolio\public  
Example references inside the site:  
/image-name.jpg  
/showreel.mp4
```

Push new assets live

```
npm.cmd run build  
git add .  
git commit -m "Add new assets"  
git push
```

If working from another computer later

Get the newest version from GitHub before making changes.

```
git pull
```

Main rule

```
Edit locally -> build -> commit -> push -> Cloudflare updates the live site
```

Note: do not unplug the external drive while PowerShell, Claude Code or VS Code is using the portfolio folder.
